Skeletal muscles always occur
in pairs - These pairs oppose each
other, One relax other Contract,

peristalsis
digest
move
stomach
Push

1. muscles that bend joints are?
2. what organs of the body are comprsd of smth muscles
3. Why r muscles often fnd in opposing prs in the body

Problem: How does Muscular system work?

Smooth	Skeletal	Cardiac
Involuntary	Voluntary	Involuntary
Not striated	Striated	Striated

Bridge pairs work in pairs (opposing), as flexor contracts, extensor extends. Muscles cause movement by becoming shorter - contracting. When muscles aint contracting they are resting & returning to their original length.

Smooth muscle - consist of distinct cells which each have it's own nucleus. No cross stripings of striations. Smooth muscle are present in walls of digestion track, respiratory passages, arteries, veins, iris of eye, bladder, uterus

Skeletal - long fibers w/ many nuclei around the fibers. They contract most rapidly - responsible for movement.
